

DO YOU HAVE EPIDERMOLYSIS BULLOSA?

Stanford Dermatology is investigating a pill called Serlopitant to see if it can help with EB-related itch. The pill is taken once daily and can be crushable for anyone with difficulty swallowing pills. There is a 50% chance that study participants may be on a placebo (sugar pill).

Option available for virtual- only visits for those whose ability to travel is restricted due to the COVID-19 pandemic.

Contact our study coordinator Katie Sum (650) 441-9974
(katiekts@stanford.edu).

For questions about participant's rights, contact 1-866-680-2906

DO YOU HAVE EB AND EXPERIENCE ITCH?

Stanford Dermatology is looking for patients with EB age 13 or older who would like to talk about their experience with itch and help us develop better surveys to measure itch. We will conduct a 1 hour interview by phone or video.

Participants will be paid \$50 for their time.
